

Microstructured surfaces

Polymer microscope slides and microarrays

Polymer microscope slides and microarrays are functionalized with wells, pillars or channels to offer an optimized surface for cell culture and life science applications.

Low brittleness and high optical quality makes them an excellent alternative to glass slides.

The benefits of microstructured surfaces

- Customized surface structures
- Optical grade polymer
- Low brittleness
- Low cost disposable
- High volume production
- Structure sizes in the sub- μm range possible
- Available in different colors
- Material e.g. Polycarbonate, PMMA, COC
